

Highest Accuracy achieved for Support Vector Machine for Binary Classification :  
0.80400390625

I achieved the result through building a pipeline for SVM using scikit -learn library with a RBF kernel and considering unigrams from the dataset.

I experimented with different features present in the data and how they can affect the truthfulness of the claim. I have explained them clearly in the notebook.

Please refer to the notebook for additional ideas and exploration.

I have also cited all libraries and code used in the notebook itself at the end.
